**Abstract:** This report presents a detailed overview of the design phase of the second iteration of the StepUp software project, developed using the C++ object-oriented programming language. The aim of this document is to define the logical and physical architecture of the system, organize the code structure and present the main design decisions using UML diagrams. Applying software architecture principles and design patterns, this report aims to guide the implementation process, ensuring modularity, ease of maintenance and clarity. Drawing up this type of report is important to ensure that everyone involved in the project is on the same page during the implementation and management of the software.

### 1 Introduction

The aim of this software project is to develop an application for managing a shoe store, called StepUp, which will have customers, suppliers and a manager. Both the customers and the manager will have access to the functionalities previously defined for each user profile.

The application will allow customers to view available products and add items to their cart without having to create an account. However, in order to finalize a purchase, they will need to register and log in to the application. Customers will also be able to consult the history of their previous orders.

The manager will be responsible for administering the store, being able to place orders with suppliers, add, delete and edit products, control stock and keep track of orders placed by customers.

### 2 Design: Physical Architecture

### 10 User Interface

Depending on the account that is logged in, the user interface will display a different tree of menus.

### 10.1 Client User Interface
